EDUCATION

Rutgers University New Brunswick, Honors College

Expected May 2028

B.S. Computer Science — Dean's List All Semesters

GPA: 3.8/4.0

Coursework: Data Structures, Data Mgmt for Data Sci, Comp Arch, Discrete Math, Lin Alg, InfoSec, Object-Oriented Prog

Activities: Rutgers USACS Road to Software Engineering (10/150); Rutgers ML/AI NLP Track (5/100+), Mobile App Dev

EXPERIENCE

IBM | Software Engineer Intern – MultiCloud SaaS Platform

May 2026 – Aug 2026

- Architected a cloud deployment service for **10+ products** across **100 environments**, reducing onboarding time by **87%**
- Engineered a thread-safe IAM caching service with proactive expiry refresh and request coalescing, reducing redundant auth calls by **80%**, eliminating stale-token failures during pipeline execution, and validating reliability with **15+ unit tests**
- Replaced a 6-step GitHub issue-template with form-based automation on **14-fields**, cutting steps by **83%** (**6 → 1**) with HMAC-authenticated GraphQL operations, Tekton CI/CD status polling every 60s on a 10 min interval on the frontend
- Validated webhooks, PR creation, and async tracking across **3 hyperscalers (AWS, Azure, IBM Cloud)** and **6 phases**.
- Eliminated **100%** of form data-loss on failure via draft persistence, covering cold-start, save, restore, and clear scenarios

PNNL | Software Engineering Intern – Emerging Threats & Technologies

Oct 2024 – Present

- Shipped **65+** Jira tickets across the DOE C2M2 web platform, implementing UI updates in React/JavaScript and integrating with Node/Python services to support self-assessment workflows used by **2,400+ organizations** through Claude and MCPs
- Built a PDF tool using pdfmake to generate self-evaluation reports; optimized manual creation time by **20+ min/report**
- Implemented client-side routing; reducing navigation steps to key assessments by **30%**; Added loading states (spinners/skeletons) for dynamic data visualizations; improved responsiveness and reduced time-to-interactive by **18%**
- Authored and maintained the Sol-ReMM Primary User Guide documenting **350+ practices** across **12 domains**

PROJECTS

Aletheia | Next.js, TypeScript, Node.js, Python, Supabase, REST APIs

Apr 2026

- Won Hack Princeton KnotAPI track with an app that used SKU purchase data, matching users and class-action settlements
- Integrated 3 KnotAPI transaction-linking flows, validating account data / transaction sync, and purchase retrieval live.
- Engineered an AI data pipeline from purchase ingestion to LLM exposure analysis, settlements, and automated filing

SentinelStream | PyTorch, XGBoost, SHAP, MLflow, FastAPI, Docker

Sept 2026

- Built an intrusion-detection pipeline for **2.8M public network flows**, achieving **0.866 test PR-AUC** with Optuna-tuned XGBoost, chronological evaluation, SHAP explanations, schema validation, PostgreSQL persistence, and MLflow tracking.
- Evaluated hybrid anomaly detection on **398K validation flows** by training a PyTorch autoencoder on **1.4M benign flows**; retained XGBoost after the hybrid improved F1 by only **0.0002**; added drift monitoring using PSI and KS statistics
- Served predictions at **6.2 ms p95 latency** in a local single-client benchmark using FastAPI and Docker containerization; validated the codebase with **166 passing tests** and **92% source coverage** in GitHub Actions.

Lemontree: Morgan Stanley Hackathon | Python, FastAPI, Pydantic, Gemini API

Mar 2026

- Architected a Hackathon food analytics backend using Python, FastAPI, and Pydantic, shipping **6 REST endpoints** with automated metadata generation request/response models, soft delete, and server-side timestamp generation
- Designed a JSON-data storage layer for user feedback across **8 search filters** for ingestion, retrieval, and analytics.
- Built issue classification and aggregation pipelines **7 issue categories** at write time, powering dashboard KPIs and rates

CS Research Assistant | Pandas, NumPy, Combinatorial Optimization, Git

Aug 2025 – Oct 2025

- Built a version-controlled Python algorithm translating downlink MIMO VPP equations, a wireless signal optimization problem, into QUBO matrices for arbitrary (N_t, N_r) configurations to support repeatable experimentation and testing.
- Validated correctness on 4×4 MIMO instances, ensuring generated QUBO coefficients matched hand-derived calculations.

TECHNICAL SKILLS AND AWARDS

Honors & Awards: HackPrinceton 2026 Award Winner (Aletheia), Outstanding Performance Award – PNNL

National Cyber Scholar; Best Written Brief: Cyber 9/12; Recipient of Dean's Scholarship (Top 2%);

Technologies: Python, Java, TypeScript, SQL, Supabase, Git, Pandas, Go, Bash, AWS, React, GitHub Actions, Express

Cloud, Data & AI: AWS, Docker, Kubernetes, Tekton CI/CD, Terraform, Git, PostgreSQL, Redis, GraphQL APIs, RAG, MCP

Certifications: CompTIA Security+, NJCCIC, Agentic AI (AutoGen, MCP, Workflow Automation), GFACT (\$3000 scholarship)
